

Poverty and Health of Children from Racial/Ethnic Minority and Immigrant Families in the Midwest

Jean Kayitsinga

Research Report No. 44

November 2010

ABSTRACT

Using data from the 2007-2009 Annual Social and Economic supplement of the Current Population Surveys, this study explores the relationship between poverty and the health of children from various racial/ethnic minority and immigrant families in the Midwest. Findings show that: racial/ethnic minority children experience poorer health than Non-Hispanic White children; increased poverty among children predicts poorer children's health; and immigrant children have poorer health than natives, and second-generation immigrant children have poorer health than first- and third-generation immigrant children. This study demonstrates the health disadvantages of Midwestern children from racial/ethnic minority families faced by poverty. The gap in children's health between Non-Hispanic White and minority children persists even after accounting for the effects of immigrant status, poverty, family structure, parental education, health insurance coverage, and metropolitan/nonmetropolitan residence. Improving the economic well-being of all racial/ethnic minority and immigrant families would improve children's health.

ABOUT THE AUTHOR

Dr. Jean Kayitsinga is a sociologist demographer for the Julian Samora Research Institute at Michigan State University (MSU). He received his Ph.D. in sociology from MSU in 1999. His areas of specialization include rural sociology, sociology of families, demography, research methods, and statistical methodologies.
